
CONTROL PLANE
GITHUB ACTIONS RUN
CUSTOMER CLOUD
1
Customer bootstrap
one-time CloudFormation or ARM template: deploy identity, state storage, onboarding role (AWS)
IDs entered at onboarding
2
Onboarding
inputs validated; keys stored encrypted (AES-256-GCM)
AWS: AssumeRole + ExternalId
write-only
Secrets Manager
AWS only
keys written before any run
3
Dispatch
workflow_dispatch with non-secret inputs only
starts the run
4
OIDC authentication
the job's token names environment tenant-{id}
Secrets release
Azure only
keys released once, to that run's verified token
Deploy identity
AWS deploy role or Azure managed identity; trusts only this tenant's subject
5
Terraform provisioning
golden images copied in; terraform init + apply
Chatbot infrastructure
containers, storage, signer, vector DB; state kept here
6
Outcome reporting
status callback with the chatbot and signer URLs
Tenant recorded
live or failed; a lost callback is recovered by polling and reconciliation
next step or call
the run calls the platform
